Tasks

Task 1: Fix the inverted arm push bug

Alternating the Left and Right arrow keys pushed the arm toward the computer's side instead of the player's side, so the player pinned themselves. The fix makes every alternating keypress move the arm toward the player's winning threshold (-100).

Task 2: Implement dynamic AI surge

The computer originally pushed at a predictable constant rate. An AI stamina cycle was added in which the computer periodically enters a brief high-power surge with increased pushing force, followed by a cooldown period with reduced resistance.

Task 3: Implement an exhaustion warning indicator

Building on the surge cycle, visual cues were added for fatigue states: a flashing warning is shown while the AI is in its power surge, and an exhaustion state is shown whenever the player's stamina drops too low to push.

Task 4: Implement counter-surge bonus resistance

Building on the warnings, strategic timing is rewarded. If the player pushes right as the AI's surge ends and its cooldown begins, the player gets a temporary stamina recovery boost and double push strength to mount a comeback.
